

The Console Loader is mounted behind the front panel of the console printer, where it will sit underneath the three pushbuttons, clear of the rest of the typewriter mechanism.

I found a handy bracket for use with Arduino style hobby projects and installed it by drilling two holes low down on the front panel where they would be covered by the 1130 tabletop in normal operation. These held the bracket behind the panel.

The sandwich of the console loader shield PCB and Arduino Mega 2560 is mounted to the bracket with suitable bolts, nuts and spacers as you can see in the pictures.
